Inspection visit for COSYS power factor correction system

APPL_493_A,EP5

This service includes several essential verifications to ensure the longevity and performance of your COSYS power factor correction system.

During the inspection by Socomec experts, the following tests will be carried out:

- Control of sensitive points, tightening torques and connections.
- Control of components: filters, fans, capacitors, fuses, contactors.
- Control of switching sequences.
- Control of power factor correction power supply availability.
- Control and update of controller settings.

Our service offers complete verification of your power factor correction system, carried out directly in its operating environment. This analysis helps identify potential areas for optimisation to ensure your system performs at its best. At the end of this inspection, you will receive a detailed report on the overall condition of your system, along with recommendations to improve its efficiency.

Key points

- > Full inspection of your COSYS system
- > All of the manufacturer's expertise at your service
- > Fully trained and equipped technical experts ready to solve any issues with your system.

Further information

This service can be included in the Flex Service Package offer.

The Flex Service Package is a customisable contract designed to meet your operational needs. This package offers unparalleled flexibility, allowing you to subscribe to a specific number of interventions per year and only to the services you actually need to exclusive expert technical support via our Weblines platform.
